Current Status of the Claims

- (previously presented) A breathable, stretchable, hydrophilic material comprising:

 a porous inner layer of stretchable fabric;
 a porous outer layer of stretchable fabric; and,
 a central layer of open cell foam fixed between said inner and outer layers to stretch with said inner and outer layers, wherein said central layer is comprised of compressed foam.
- 2. (previously presented) The material according to claim 1, wherein said inner layer includes a blend of polyester and spandex.
- 3. (previously presented) The material according to claim 2, wherein said blend is about 83% polyester and about 17% spandex.
- 4. (previously presented) The material according to claim 1, wherein said outer layer includes a blend of nylon and spandex.
- 5. (previously presented) The material according to claim 4, wherein said blend includes about 8.99% bright nylon, about 10.85% semi-dull nylon, and about 80.16% bright spandex.
- 6. (original) The material according to claim 1, wherein said outer layer includes a plurality of loops for hook-and-loop fastening.
- 7. (cancelled)
- 8. (previously presented) The material according to claim 1, wherein said central layer of open cell foam is compressed at a four-to-one ratio of original thickness to compressed thickness.

9. (previously presented) The material according to claim 1, wherein said central layer of compressed open cell foam is polyurethane foam.

1 41

- 10. (original) The material according to claim 1, wherein said central layer is flame laminated to said inner layer.
- 11. (original) The material according to claim !, wherein said central layer is flame laminated to said outer layer.
- 12. (original) The material according to claim 1, wherein said central layer is flame laminated to said outer layer and said inner layer.
- 13. (withdrawn) A method of manufacturing a breathable, stretchable, hydrophilic material comprising the steps of:
- (A) flame laminating an outer layer of porous stretchable fabric to a central layer of compressed open cell foam to form a two-layer composite material;
 - (B) curing said two-layer composite material for a period of time; and
- (C) flame laminating an inner layer of porous stretchable fabric to a central layer of compressed open cell foam to form a three-layer composite material; and
 - (D) curing said three-layer composite material for a period of time.
- 14. (withdrawn) A method of manufacturing a breathable, stretchable, hydrophilic material comprising the steps of:
- (A) flame laminating an outer layer of porous stretchable fabric to one side of a central layer of compressed open cell foam and simultaneously flame laminating an inner layer of porous stretchable fabric to an opposite side of said central layer to form a three-layer composite material; and
 - (B) curing said three-layer composite material for a period of time.
